Reset	√	√	√

#### Attention

- It takes about 30 minutes for the performance of electrical parts to stabilize. Please wait 30 minutes or more after the monitor power has been turned on, and then adjust the monitor.
- Perform the range adjustment first when adjusting color for analog signals (see "Auto Range Adjust" (page 20)).
- The same image may be seen in different colors on multiple monitors due to their monitor-specific characteristics. Make fine color adjustment visually when matching colors on multiple monitors.

### ● Brightness

The screen brightness is adjusted by changing the brightness of the backlight (light source from the LCD back panel).

#### Adjustable range

0 to 100

#### Note

- If you feel that the image is too dark even if the brightness is set to 100, adjust the contrast.

## ● Contrast

The brightness of the screen is adjusted by varying the video signal level.

### **Adjustable range**

0 to 100

---

#### **Note**

- In the contrast of 50, every color gradation is displayed.
  - When adjusting the monitor, it is recommended to perform the brightness adjustment which may not lose the gradation characteristics, prior to the contrast adjustment.
  - Perform the contrast adjustment in the following cases.
    - If the image is too dark even when the brightness is set to 100 (Set the contrast to higher than 50.)
- 

## ● Temperature

Color temperature can be adjusted.

The color temperature is normally used to express the hue of "White" and / or "Black" by a numerical value. The value is expressed in degrees "K" (Kelvin).

The screen becomes reddish at a low color temperature, and bluish at a high color temperature, like the flame temperature. The gain preset values are set for each color temperature setting value.

### **Adjustable range**

Off / 4000 K to 10000 K (specified by every 500 K unit, including 9300 K)

---

#### **Note**

- The value shown in "K" is available only as reference.
  - Selecting "Advanced Settings" - "Gain" allows you to perform more advanced adjustment (see ["Gain" \(page 18\)](#)).
  - If you set to "Off", the image is displayed in the preset color of the monitor (Gain: 100 for each RGB).
  - When gain is changed, the color temperature is changed to "Off".
- 

## ● Gamma

Gamma can be adjusted. The brightness of the monitor varies depending on the input signal, however, the variation rate is not proportional to the input signal. Maintaining the balance between the input signal and the brightness of the monitor is called "Gamma correction".

### **Adjustable range**

1.8 / 2.0 / 2.2

---

#### **Note**

- If "sRGB" is selected for the color mode, "2.2" is displayed for the gamma value.
-
